

Recording machines

We are teaching a phone to hear when an engine or generator needs attention. It learns from machines it has heard both healthy and unwell. The verdict afterward is the part we cannot get anywhere else: healthy confirmed, or a mechanic's actual finding.

BEFORE ANY RECORDING

- Phone flat and still, close to the machine, wherever you'd normally stand to listen to it.
- Record the machine exactly as it actually runs. Never change anything about it to get a “cleaner” recording.
- Nothing changes about how you work on it. If anything feels wrong, stop.

When you're at a machine

1. **Pick it from the list, or add it if this is the first time.** Name it, say Petrol or Diesel, say what kind of machine. The app remembers it from here on.
2. **Not enrolled yet? Only enrol while it's running normally, nothing wrong with it right now.** Enrol records six ten-second clips. Phone still, against or near the machine. The screen counts them down for you.
3. **Already enrolled? Check it any time.** Ten seconds, phone still. You get an answer on the spot: sounds like itself, worth checking, or get it looked at.
4. **A Check isn't finished yet.** It queues the recording with the app's own guess, not a real answer.
5. **When you or a mechanic actually find out what was going on, go back to that machine and add the verdict.** Say what was really true. This is the step that makes a Check worth anything at all.
6. **If a mechanic finds something Injini missed, that machine gets flagged “needs re-enrollment.”** Enrol it again once it's genuinely healthy.
7. **From the Machines screen, export the whole collection any time.** Share it over WhatsApp, save it to Drive, or sync it straight in if you have data.

IF YOU ENROL SOMETHING THAT ISN'T ACTUALLY HEALTHY, EVERY CHECK AFTER IT IS WRONG

- Enrol builds the machine's whole idea of “normal.” Whatever it hears during those six clips, it believes is fine.
- If the machine already has a problem when you enrol it, that problem becomes the new “healthy.”
- Not sure it's genuinely healthy right now? Check it instead of enrolling it, and come back to Enrol later.

THE VERDICT IS THE VALUABLE PART, NOT THE RECORDING

- Any phone can record ten seconds of an engine. Only a person can say afterward what was actually wrong, or that nothing was.
- A Check with no verdict ever added teaches the model nothing at all.
- Short on time today? Go back and add verdicts to machines with recordings waiting before you record anything new.

Three things not to do

- **Never change how the machine runs to get a cleaner recording.** Record it exactly as it actually sounds, faults and all.
- **Don't talk or make noise near the phone while it's recording.** It's listening for the engine, not you.
- **Don't discard a recording because the verdict surprised you.** Discard only if the recording itself was bad: wrong machine, phone moved, too much wind or noise.
